A worked task: Lesson 1, Round 3, build the smoothie machine

WRITTEN INSTRUCTIONS · LESSON 1 README

"Inspect the ingredient files and add an ingredient with nano. Write make_smoothie.sh following the game's short scripting exercise. Read the script, identify its inputs and output, and run it with Bash. Open smoothie.txt and check that the expected ingredient text appears."

+

PEER DEMONSTRATION

Tiffany Huang works through the same round on screen.

---

1 Write the script

```
#!/bin/bash
echo "Blending your smoothie..."
cat ingredients/*.txt > smoothie.txt
echo "Done. Read it with: cat smoothie.txt"
```

The lesson gives these four lines to type into make_smoothie.sh in nano. The highlighted line joins every .txt file in ingredients/, and the > sign writes the result into smoothie.txt. The ingredient files are not changed.

---

2 Run it

```
$ bash make_smoothie.sh
Blending your smoothie...
Done. Read it with: cat smoothie.txt
```

`bash make_smoothie.sh` runs the script. Its two echo lines report what it is doing.

---

3 Check the output

```
$ cat smoothie.txt
Banana — one whole banana, sweet and creamy.
Honey — a spoonful of honey for sweetness.
Mango - one ripe mango, peeled and diced.
Milk — one cup of your favorite milk.
Strawberry — a handful of fresh strawberries.
```

smoothie.txt holds one line from each ingredient file, including mango.txt, which the learner added with nano.

Terminal text typeset from Tiffany Huang's walkthrough (03:19–05:13), with her prompt shortened to $. The numbered steps show the intended order of work, not a tested learning mechanism.
