A Finish the task and check the result

Example: Lesson 4, Round 5, a simulated cluster job.

```
$ bash scripts/submit_laundry_job.sh
Submitted fake laundry cluster job: <ID>
…
Job finished.
$ cat remote_laundromat/logs/latest_job.log
…
Starting the PI Laundromat remote washer...
Remote cleaned remote_labcoat
…
Done. Remote cleaned 5 item(s).
$ bash scripts/check_remote_laundry.sh
Checking remote_laundromat/clean_laundry/...
5 remote clean item(s) found.
```

Excerpts from a clean run of the current game files; "…" marks lines left out, and the job ID and date vary. The job runs on the learner's computer and connects to no real server.

B Answer the five shared prompts in a short video

Every lesson uses the same five questions.

1. What did this game teach you how to do?
2. What was one moment where you got stuck, confused, or had to slow down?
3. What command, file, or folder felt most important in this game?
4. How do you think this game might help you with real research or MRI work?
5. What would you do first if you had to solve a similar problem on your own?

Learners may record their screen, narrate slides, or speak to the camera. Showing their face is optional.
